Create an Aggregation Pipeline

The Aggregation Pipeline Builder in MongoDB Compass helps you create **aggregation pipelines** to process documents from a collection or view and return computed results.

About this Task

MongoDB Compass provides different modes to create aggregation pipelines:

Stage View Mode, a visual pipeline editor that preloads pipeline syntax based on your selected stages.

Stage Wizard, a feature of Stage View Mode that provides a set of templates for simple aggregation stage use cases. The Stage Wizard only includes simple use cases to help you get started with your aggregation pipeline.

Focus Mode, a feature of Stage View Mode where you edit one pipeline stage at a time. Focus Mode helps you manage complex or deeply nested aggregation pipeline stages.

Text View Mode, a text-based pipeline editor that accepts raw pipeline syntax.

Before You Begin

To build an aggregation pipeline, choose a collection and click the **Aggregations** tab. Compass displays a blank aggregation pipeline. The **Preview of Documents in the Collection** section shows 10 documents randomly sampled from the chosen collection.

NOTE

Atlas Search Stages

When you connect Compass to a MongoDB deployment hosted on **Atlas**, additional Atlas-only stages **\$search** and **\$searchMeta** are available in the Aggregation Pipeline Builder. Use these stages to perform **full-text search** on Atlas collections.

Steps

To see how to create an aggregation pipeline, select the tab corresponding to your chosen view mode:

Stage View Mode

Stage Wizard

Focus Mode

Text View Mode

1

Select the Stages view

In the aggregation pipeline pane, ensure the **{ } Stages** toggle switch is selected.

{ } STAGES

</> TEXT

✖

⚙

click to enlarge

2

Add an aggregation stage

At the bottom of the aggregation pipeline pane, click the **+ Add Stage** button.

3

Select an aggregation pipeline stage

On the upper-left corner of the aggregation stage card, click the **Select** drop-down menu and select the **aggregation pipeline stage** to use for the first stage of the pipeline.

4

Fill in your pipeline stage

Fill in your selected stage. You can adjust the width of the pipeline stage by dragging its border to the right.

NOTE

The toggle to the right of each pipeline stage name dictates whether that stage is included in the pipeline. Toggling a pipeline stage also updates the pipeline preview, which updates based on whether or not that stage is included.

For example, the following pipeline excludes the first **\$match** stage and only includes the **\$project** stage:

Stage 1 \$match

☐

Stage disabled. Results not passed in the pipeline.

```
1 </> /*+
2 *
3 * query: The query in MQL.
4 */
5 {
6   year: 2000,
7   genres: "Action"
8 }
```

No Preview Documents

Stage 2 \$project

☒

Output after \$project stage (Sample of 10 documents)

```
1 </> /*+
2 * specifications: The fields to
3 * include or exclude.
4 */
5 {
6   title: 1,
7   rated: 1,
8   plot: 1
9 }
```

```
{_id: ObjectId('573a1390f29313caabdc4135')}
plot: "Three men hammer on an anvil and pass a
bottle of beer around."
title: "Blacksmith Scene"
rated: "UNRATED"
```

```
{_id: ObjectId('573a1390f29313caabdc4135')}
plot: "A gr
hold-
title: "The
rated: "TV-
```

5

Add additional pipeline stages

To add an additional pipeline stage after your last aggregation stage, click **Add Stage**. To add an aggregation stage before your most recently added stage, click the **+** icon above the stage card.

Repeat steps 3 and 4 for each additional stage.

NOTE

You can change the order of pipeline stages by dragging the header of each stage card.

6

Run the pipeline

At the top-right corner of the pipeline builder, click **Run**. Compass returns your results in the document view.

WARNING

Some aggregation operators, like **\$merge** and **\$out**, can modify your collection's data.

If your aggregation pipeline contains operators that can modify your collection's data, you are prompted for confirmation before the pipeline is executed.
